What is Anti-Bacterial Protection?

without protection treatment

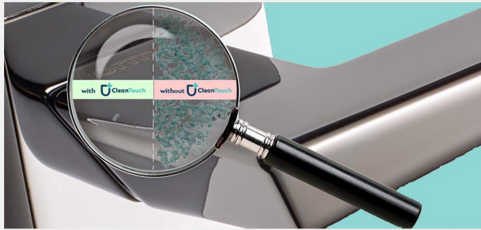

after 80minutes - 0% of bacteria

with protection treatment

It is scientifically proved through certified lab results that the anti-bacterial treatment used to coat these products ensures total elimination of bacteria.

As soon as the bacteria comes into contact with the anti-bacterial finishing, the coating immediately interrupts its biological operation. The bacteria can not grow nor reproduce and their life cycle ends.

Although this protection doesn't delay the outbreak of an epidemic, it reduces the risk of spreading. It guarantees the protection of people within their environment.

This particular finishing treatment is not toxic, unlike some anti-bacterial powder varnishes.

99.9% cleaner than unprotected surfaces

The special layer of protection on Cleantouch ironmongery slowly releases silver ions, which penetrates the bacteria membrane, compromising the reproduction and eventually killing the germs and protecting the door handle against microbes.
